At Intersolar 2009 SunEnergy Europe will be presenting itself as an experienced plant planning and development company with an international orientation

Hamburg, 26 May 2009: At Intersolar 2009, Hamburg-based photovoltaic systems provider SunEnergy Europe GmbH will be showcasing its extensive experience in the planning and construction of photovoltaic plants and its long-established presence on the international market.

This year, SunEnergy Europe's range of products and services particularly targets partners and customers with whom large roof-mounted and free-standing installations can be realised. As a general contractor, SunEnergy Europe has long been a popular provider for the installation of turnkey solar power plants.

In December 2008, for example, a 2-MW dual-axle free-standing tracking installation was completed on time close to the Danish border. Free-standing installations, which only a few months ago were relatively rare due to low feed-in tariffs, could become a popular trend in 2009.

"We have noticed an increased interest in this market segment at all levels," says Dr Hartwig Westphalen, CEO of SunEnergy Europe GmbH. "Module prices have become considerably more attractive since the beginning of the year, with the result that the running of solar parks has become an ideal business venture – especially for farmers."

For many years now, the company has been proving its high level of flexibility and its ability to provide customers with products tailored perfectly to their needs. The main focus is on tried and tested use-oriented solutions such as the SunEnergy Energy Shed. With this concept, the solar installation not only pays for itself, but also funds the construction of the shed.

Investors can also directly benefit from SunEnergy's many national and international projects. Participation in a solar investment offers returns which can be calculated over a period of decades, and represents a particularly interesting option for investors given the reliable German funding regulations. This combination of sustainable energy generation and sustainable investment is the direct result of SunEnergy Europe's high quality standards.

"All components used in SunEnergy projects must first pass the company's own stringent quality assurance tests," explains Dr. Hartwig Westphalen. "In particular, the Sharp

modules used in our installations have proven to be a guarantee for above-average yields."

The German solar market is continuing to provide an important and stable foundation for SunEnergy Europe in 2009. In addition, the company is also continuing to pursue its internationalization strategy, which has been very successful in the past. Alongside established solar markets like Spain, Italy or France, the company is also becoming increasingly active in Eastern European countries such as Bulgaria and the Czech Republic.

Free-standing installation in Sprakebüll with dual-axle tracking (Nordfriesland/Schleswig-Holstein)
